

IN THE ABSTRACT OF DISCLOSURE:

Please delete the current Abstract and insert the following:

A disk selecting device for storing a plurality of disks that can be separated to provide a space for receiving a disk drive unit to play a selected disk within the disk selecting device. A plurality of trays are mounted within the disk selecting device including a drum cam that can be rotated by a drum gear driven by a drive mechanism so that a disk selecting cam groove does not contact those trays that do not contain the disk to be selected for playing whereby a sufficient space is provided to drive the selected disk.
